

ABSTRACT OF THE DISCLOSURE:

The invention relates to establishing a telephone or other telecommunications connection between at least two persons, requiring both of them to be present at each end of the connection. Particularly the invention concerns taking into account the fact that the local time may be different at different ends of the connection. The objective of the invention is to reduce telephone calls coming at an inconvenient time because of the time difference, and to make it easier to identify them. When the command to set up a call connection is given, the time parameter of the destination is determined. If a time difference is found to exist between the destination and the device requesting the speech connection, an indication of this is given to the party who wants the speech connection. After this, the request to set up a speech connection can still be cancelled, if it seems advisable.
